### Exercise sheet 7: Markov chains

# Exercise 1 - Up-to-date or Behind

Alex is taking a bioinformatic class and in each week he can be either up-to-date or he may have fallen behind. If he is up-to-date in a given week, the probability that he will be up-to-date in the next week is 0.75. If he is behind in the given week, the probability that he will be up-to-date in the next week is 0.5.

If we assume that these probabilities do not depend on whether he was up-to-date or behind in previous weeks, we can model the problem using a Markov chain.

1a)

Draw a Markov chain that models the states of being Up-to-date or behind

Hide

Solution

1b)

Assume Alex is up-to-date in the first class; what is the probability that he is up-to-date two classes later?

Hide

Hint: Formulae

$$\pi(0): initial\ probabilities$$
 (1)

$$P: transition \ matrix$$
 (2)

$$\pi(t) = \pi(0) * P^t \tag{3}$$

**Solution** The Probability is 0.6875

$$\pi(0) = \begin{pmatrix} 1 & 0 \end{pmatrix} \tag{4}$$

$$P = \begin{pmatrix} 0.75 & 0.25 \\ 0.5 & 0.5 \end{pmatrix} \tag{6}$$

(7)

$$\pi(2) = \pi(0) \times P^2 \tag{8}$$

$$= (0.6875 \quad 0.3125) \tag{9}$$

1c)

What is the expected probability that he is behind after an infinitely long semester?

Hide

Hint: Formulae

$$\pi(0)$$
: initial probabilities (10)

$$P: transition \ matrix$$
 (11)

$$\lim_{t \to \infty} \pi(t) = \pi(0) * P^t \tag{12}$$

**Solution** The Probability is 2/3

$$\lim_{t\to\infty}\pi(t)=\pi(0)*P^t=\begin{pmatrix}2/3&1/3\end{pmatrix}$$

1d)

What is the transition probability matrix product for limit of  $P^t$  as t approaches infinity?

Hide

Solution

$$\lim_{t \to \infty} P^t = \begin{pmatrix} 2/3 & 1/3 \\ 2/3 & 1/3 \end{pmatrix} \tag{13}$$

# Exercise 2 - Stationary distribution

Consider a three-state Markov chain having the following transition probability matrix:

$$\begin{pmatrix}
0.5 & 0.4 & 0.1 \\
0.3 & 0.4 & 0.3 \\
0.2 & 0.3 & 0.5
\end{pmatrix}$$

2a)

In the long run, what proportion of time is the process in each of the three states?

Hide

**Hint: Formulae** See Question 1B

Correct Answer

$$\lim_{x \to \infty} P^t = \begin{pmatrix} 0.339 & 0.371 & 0.290 \\ 0.339 & 0.371 & 0.290 \\ 0.339 & 0.371 & 0.290 \end{pmatrix}$$
(14)

(15)

$$\lim_{t \to \infty} \pi(t) = \begin{pmatrix} 0.339 & 0.371 & 0.290 \end{pmatrix} \tag{16}$$

rix \end{align}

Note

$$\lim_{t\to\infty}\pi(t)$$

is independent of  $\pi(0)$  as long as P does not contain disconnected subgraphs and only if the limit exists.

# Exercise 3 - Reversibility

Consider a three-state Markov chain having the following transition probability matrix

$$\begin{pmatrix} 0 & 1 & 0 \\ \frac{1}{3} & 0 & \frac{2}{3} \\ 0 & 1 & 0 \end{pmatrix}$$

3a)

Draw the Markov chain for this problem

Hide

Solution

3b)

Given the stationary distribution  $\left(\frac{1}{6} \quad \frac{1}{2} \quad \frac{1}{3}\right)$ , is this Markov chain reversible and what does this property tell you?

Hide

Hint A markov chain is reversible if:

$$\pi_i^* P_{i,j} = \pi_j^* P_{j,i}$$

Easiest way is to calculate it for all pairs of i and j

**Solution** Because  $\pi_i^* P_{i,j} = \pi_j^* P_{j,i} \ \forall \ i,j$  the Markov chain is reversible

$$\pi_1^* P_{1,2} = \frac{1}{6} \times 1 = \frac{1}{6} = \frac{1}{2} \times \frac{1}{3} = \pi_2^* P_{2,1} \qquad (17)$$

$$\pi_1^* P_{1,3} = \frac{1}{6} \times 0 = 0 = \frac{1}{3} \times 0 = \pi_3^* P_{3,1} \qquad (18)$$

$$\pi_2^* P_{2,3} = \frac{1}{2} \times \frac{2}{3} = \frac{1}{3} = \frac{1}{3} \times 1 = \pi_3^* P_{3,2} \qquad (19)$$

$$\pi_1^* P_{1,3} = \frac{1}{6} \times 0 = 0 = \frac{1}{3} \times 0 = \pi_3^* P_{3,1}$$
 (18)

$$\pi_2^* P_{2,3} = \frac{1}{2} \times \frac{2}{3} = \frac{1}{3} \times 1 = \pi_3^* P_{3,2}$$
 (19)

Exercise 4 - Markov chain representation
4a)
Decide which of the following figures represents a valid Markov Chain
Hide
Solution
<ul> <li>□ ii - initial probabilities add up to 0.2</li> <li>□ iii - transition probabilities for states A and B do not add up to 1</li> <li>□ iv - duplicate state A</li> <li>□ v - initial probabilities add up to 1.1</li> <li>⋈ vi</li> </ul>
$\Box$ vii missing transition probabilites (0.1) for state C
<b>4</b> b)
Which of these statements about Markov Chains are valid?
Statements
<ul> <li>□ In the graph representation of Markov chains, a single state cannot have more than 3 outgoing edges</li> <li>□ In the matrix representation of Markov chains, values in each row have to add up to 1.</li> <li>□ In the matrix representation of Markov chains, values in each column have to add up to 1.</li> <li>□ The diagonal entries of the Markov chain matrix represent the transition probability of remaining in the current state.</li> </ul>
☐ In the graph representation of Markov chains, a single state cannot have more than 3 ingoing edges. ☐ The graph representation of Markov chains is directed and acyclic by definition.
Solution
<ul> <li>□ In the graph representation of Markov chains, a single state cannot have more than 3 outgoing edges</li> <li>□ In the matrix representation of Markov chains, values in each row have to add up to 1.</li> <li>□ In the matrix representation of Markov chains, values in each column have to add up to 1.</li> <li>□ The diagonal entries of the Markov chain matrix represent the transition probability of remaining i the current state.</li> <li>□ In the graph representation of Markov chains, a single state cannot have more than 3 ingoing edges.</li> </ul>

 $\hfill\Box$  The graph representation of Markov chains is directed and acyclic by definition.
